

A user can have multiple roles and roles can have multiple users (m : m), forming the UserRole join table.

When an NCR is unable to be reinspected, a new NCR is created. The original NCR will reference the newly created one. One NCR has at most one replacement NCR and an NCR is the replacement for at most one original. (0 - 1 : 0 - 1)

Over the NCR lifecycle, it will be edited by several people of various roles, or possibly an individual who has multiple roles. Either way, many people can edit many NCRs and NCRs can be edited by many people (m:m) forming the NCRUser join table.

An NCR can have zero, one or many attachments, but an attachment **must** have one NCR (1 - 0 - m : 1).

An item can have zero, one or more NCRs, while an NCR **must** have one item (1 - 0 - m : 1).

An NCR is usually documenting a singular problem type. A problem type can have many NCRs (1 : m).
